SUMMARY

Data scientist with expertise in Python, SQL, and large-scale data analysis. Skilled in designing A/B tests and applying causal inference methods to extract insights from observational data, with experience in data mining, statistical methods, predictive modeling, and experimentation techniques. Adept at transforming complex data into actionable business insights to support strategic product decisions across cross-functional stakeholders.

EDUCATION

The University of Texas at Austin <i>Ph.D. in Finance</i>	Austin, TX Aug 2025
Korea University <i>B.B.A. B.S. in Business Administration and Statistics</i>	Seoul, South Korea Feb 2018

EXPERIENCE

Center on Municipal Capital Markets, The University of Texas at Austin <i>Postdoctoral Researcher</i>	Austin, TX Aug 2025 to Present
---	-----------------------------------

- Implement robust causal inference estimators and machine learning models to advance empirical research on municipal finance topics
- Engineer high-volume datasets with Python, SQL, SAS, and Stata, integrating scraped web data, parsed text records, and large finance datasets such as MSRB transactions data (40GB+)
- Engage with public finance professionals to gather applied insight and offer evidence-based guidance on municipal capital market issues

The University of Texas at Austin <i>Graduate Researcher</i>	Austin, TX Sep 2018 – Aug 2025
--	-----------------------------------

- Led multiple end-to-end data-driven projects using experimental design, A/B testing frameworks, and causal inference models such as 2SLS IV to evaluate policy impacts.
- Conducted empirical analysis on large-scale market datasets, including CRSP (110GB+), using Python, SQL, SAS, and Stata.
- Developed data-driven narratives and statistical reports for academic and non-technical audiences, presented findings at international academic conferences (e.g., FIRS 2025).

Texas Education Agency <i>Independent Researcher</i>	Austin, TX Feb 2022 – Present
--	----------------------------------

- Designed high-impact experiments and implemented econometric models (e.g., 2SLS IV, Difference-in-Differences) to evaluate state-led debt relief programs, applying advanced statistical techniques and predictive modeling.
- Performed large-scale data wrangling and ETL on 160M+ longitudinal education administrative records to produce clean inputs powering the experimentation pipeline.
- Applied experimentation techniques to identify the impact of \$1,000/pupil capital investment on math score improvements (+0.12 SD), supporting stakeholder decision-making.

Statistics Without Borders <i>Volunteer Data Scientist</i>	Remote Mar 2025 - Present
--	------------------------------

- Conducted targeted data exploration for a project with XCSS, a French nonprofit focused on climate adaptation and environmental education, by sourcing, evaluating, and documenting datasets on actual and virtual water use, identifying gaps, and organizing findings by relevance and type.
- Contributed to the approval of project findings by the client in June 2025, allowing the project to move forward to Phase 2 focused on statistical analysis and deeper environmental research.

BGF Retail <i>Project Intern</i>	Seoul, South Korea Dec 2016 – Feb 2017
--	---

- Applied data science and analytics expertise to design a store classification system using customer sales data and machine learning (e.g., K-means clustering), supporting localized product optimization and providing analytical services to client organizations.
- Presented data-driven insights and impactful recommendations to senior leadership, aligning analytics solutions with decision-making and measurable business outcomes.

TECHNICAL SKILLS

- *Programming Languages:* Python, SQL, SAS, Stata, R, Excel
- *Quantitative Methods:* Causal Inference (DiD, RDD, IV, Synthetic Controls, Propensity Score Matching), Statistical modeling, Predictive modeling, Machine learning (scikit-learn, XGBoost), A/B testing, Optimization models, Experimentation techniques, Unstructured data analysis
